May 19, 2013

1 Part 1 - Mathematica

I am familiar with Mathematica and have included a sample notebook from another class that finds a polynomial expression for given data.

2 Part 1 - Series Expansion

2.1 SerCos and SerSin

I have defined two functions SerCos[x, n] and SerSin[x, n] that are the series expansion of Cos and Sin of x respectively out to n terms. Below is a plot of SerSin[x, n] - Sin[x] for various values of n.

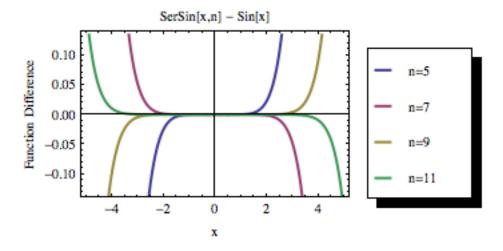

Figure 1: Difference between SerSin and Sin for various values of n

We can see that as n increases, the range of values for which the difference is 0 increases. If n = 2a + 1, then for even values of a, SerSin underestimates x < 0 and overestimates x > 0. The opposite is true for odd values of a. This

happens because when a is even, the last expansion term is positive meaning the next term would subtract value form it since the sign alternate. The errors get larger and larger the further from 0 we go.

2.2 SerCosSq and SerSinSq

 $SerCos^2 + SerSin^2$ does not uniformly equal one. Since they have different powers, the two expansions do not perfectly cancel out one another. Cos is even, while Sin is odd. As n increases, the range of values for which the sum is 1 (around 0) increases but it is not uniformly correct. The error eventually diverges to infinity.

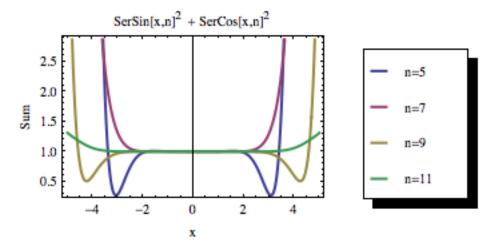

Figure 2: Sum of $SerSin^2 + SerCos^2$ for various values of n

SerCosSq + SerSinSq, where these are the expansions of Sin^2 and Cos^2 respectively, always sum to 1. Both of these are even functions that vary only by a single 1 in the Cosine expansion and the sign of each term. Therefore, the sum of the two will always be equal to 1 for any value of n.

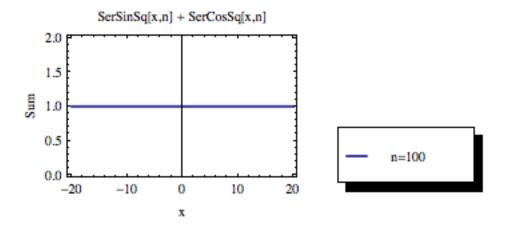

Figure 3: Sum of SerSinSq + SerCosSq for n=100

3 Part 3 - Euler Expansion

Using the definitions provided, I made functions for Rx[th], Ry[ski], and Rz[phi]. Rot3 uses Euler's Expression to make another function:

$$Rot3[a1, a2, a3] := Rz[a1].Rx[a2].Rz[a3]$$

This expression does not simplify.

Rot3Inverse using negative angles is defined in terms of Rot3:

$$Rot3Inverse[a1, a2, a3] := Rot3[-a3, -a2, -a1]$$

The product is a very complicated expression of the three initial matrices, but luckily it simplifies to the identity matrix as expected.

Using Mathematica's Inverse function, we can get another complicated expression for Inverse [Rot3[x,y,z]] . Rot3[x,y,z], but again it simplifies to the identity matrix as expected.

Finally, by computing Rot3Inverse[x,y,z] - Inverse[Rot3[x,y,z]], we get our most complicated expression yet, but once we simplify it, we get the zero matrix meaning the two expressions are indeed equivalent.

4 Code and Info

4.1 Code

Code for this week's set is appended at the end of the file as a pdf version of the Mathematica code.

Lab 4 - Series Expansions

In[189]:= Needs["PlotLegends`"]
 dir = NotebookDirectory[];
 SetDirectory[dir];

Series Sin and Cosine around x=0 out to n terms.

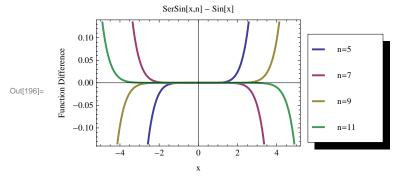

$$ln[192]:= SerCos[x_, n_] := Normal[Series[Cos[a], {a, 0, n}]] /. a \rightarrow x$$

$$ln[193] = SerSin[x_, n_] := Normal[Series[Sin[a], {a, 0, n}]] /. a \rightarrow x$$

Evaluate the difference between SerSin and Sin.

$$ln[195]:=$$
 data = Table[serSinDiff[x, n], {n, 5, 11, 2}]

$$\begin{aligned} & \text{Out} [\text{195}] = \ \left\{ \mathbf{x} - \frac{\mathbf{x}^3}{6} + \frac{\mathbf{x}^5}{120} - \text{Sin}[\mathbf{x}] \ , \ \mathbf{x} - \frac{\mathbf{x}^3}{6} + \frac{\mathbf{x}^5}{120} - \frac{\mathbf{x}^7}{5040} - \text{Sin}[\mathbf{x}] \ , \\ & \mathbf{x} - \frac{\mathbf{x}^3}{6} + \frac{\mathbf{x}^5}{120} - \frac{\mathbf{x}^7}{5040} + \frac{\mathbf{x}^9}{362880} - \text{Sin}[\mathbf{x}] \ , \ \mathbf{x} - \frac{\mathbf{x}^3}{6} + \frac{\mathbf{x}^5}{120} - \frac{\mathbf{x}^7}{5040} + \frac{\mathbf{x}^9}{362880} - \frac{\mathbf{x}^{11}}{39916800} - \text{Sin}[\mathbf{x}] \ \right\} \end{aligned}$$
